DEFINITIONS AND EXPLANATORY NOTES

AGE DEPENDENCY RATIO:

The ratio of persons in the “dependent” ages (under 15 and over 64 years) to those in the “economically productive” ages (15-64 years) in a population.

$$\frac{\text{Population} < 15 + \text{Population} > 64 \times 100}{\text{Population} 15 - 64}$$

OLD AGE DEPENDENCY RATIO:

The ratio of persons aged 65 and over to those aged 15-64 years

$$\frac{\text{Population} 65 \text{ and over} \times 100}{\text{Population} 15 - 64}$$

YOUTH DEPENDENCY RATIO:

The ratio of those aged under 15 to those 15 – 64 years

$$\frac{\text{Population} < 15 \times 100}{\text{Population} 15-64}$$

SEX RATIO

The ratio of males to females in a given population, usually expressed as the number of males for every 100 females.

$$\frac{\text{Number of Males} \times 100}{\text{Number of Females}}$$

FERTILITY

CRUDE BIRTH RATE:

The number of live births per 1,000 population in a given year.

$$\frac{\text{Number of Live Births in the year X 1000}}{\text{Mid - Year Population}}$$

GENERAL FERTILITY RATE

The number of live births per 1,000 women aged 15 – 49 years in a given year. It is a refined measure than Crude Birth Rate because it relates births more nearly to the age-group at risk of giving birth (i.e. women 15 – 49 years)

$$\frac{\text{Number of Live births X 1000}}{\text{Number of women aged 15 – 49}}$$

GROSS REPRODUCTION RATE:

The average number of daughters that would be born to a woman (or group of women) during her lifetime if she passed through her childbearing years conforming to the age specific fertility rates of a given year.

AGE SPECIFIC FERTILITY RATES:

The number of births for every 1,000 women in specific age groups. It is used for comparison over time or to see differences in fertility behavior at different ages.

$$\frac{\text{Number of births to women in specific age group X 1000}}{\text{Number of women in specific age group}}$$

TOTAL FERTILITY RATE:

The average number of children that would be born alive to a woman (or group of women) during her lifetime if the present fertility rate continues unchanged.

The Total Fertility Rate (TFR) is one of the most useful indicators of fertility because it gives as good an answer as possible to the question: How many children are women having nowadays?

$$\frac{\sum \text{Age Specific Fertility Rate} \times 5}{1000}$$

MORTALITY

CRUDE DEATH RATE

The number of deaths per 1,000 population in a given year.

$$\frac{\text{Number of deaths in a year} \times 1000}{\text{Mid - Year Population}}$$

NEONATAL MORTALITY RATE:

The number of deaths to infants under 28 days of age in a given year per 1,000 live births in that year.

$$\frac{\text{Number of deaths to infants under 28 days} \times 1000}{\text{Number of Live-Births in year}}$$

POST NEONATAL MORTALITY RATE:

The number of deaths to infants aged 28 days to 1 year per 1,000, live-births in a given year.

$$\frac{\text{Number of deaths to infants 28 days - one year} \times 1000}{\text{Number of live - births in year}}$$

INFANT MORTALITY RATE:

The number of deaths to infants under 1 year of age per 1,000 live – births in a given year.

$$\frac{\text{Number of deaths to infants 0-1 year X 1000}}{\text{Number of live – births in year}}$$

POPULATION CHANGE

RATE OF NATURAL INCREASE:

The rate at which a population is increasing (or decreasing in a given year due to a surplus (or deficit) of births over death expressed as a percentage of the base population.

$$\frac{\text{Birth in a given year – Deaths in the same year X 1000}}{\text{Mid – year Population}}$$

ANALYSIS OF VITAL STATISTICS

The Vital Statistics Report for 2014 features Live births, Deaths, Marriage and Divorces for the years 2013 and 2014.

LIVEBIRTHS

Total live births fluctuated during the period under review. A total of one thousand eight hundred and thirty eight births (1,838) were recorded for the year 2013, whilst for the year 2014 there were a total of one thousand seven hundred and fifty (1,750) live births representing a slight decrease of 4.8%.

The human species has an inherent bias in its male to female sex ratio at birth, however, this was not the case in the year 2013 because a slightly higher number of female births were recorded. The total numbers of female births were nine hundred and twenty two (922) whilst the total numbers of male births were nine hundred and sixteen (916). In the year 2014 there were more male births than female births. During that year nine hundred (900) male births were recorded compared to the eight hundred and fifty (850) female births during that same year.

The crude birth rate, which is defined as the number of live births per thousands (1,000) population in a given year experienced similar movements as total live births. In 2013 the crude birth rate was 16.9 and decreased to 16.0 in 2014.

Total fertility rate which shows the average number of children that would be born alive to a woman (or group of women) during her lifetime, if the fertility rate remains unchanged is also influenced by the total number of live births and experienced the same fluctuations as the total number of live births and the crude birth rate. In 2013 total fertility was 2.1, and in 2014 it decreased slightly to 2.0.

An analysis of births by parish of occurrence shows that for the period under review over eighty percent of all births occurred in the parish of St. George's. The second largest number of births occurred in the Parish of St. Andrew's, which was followed by Carriacou, which includes Petit Martinique for the purpose of this analysis. There were births occurring in the other parishes, however they were small in numbers. Even though the majority of births occurred in St. George's during the period, the majority of the births were of mothers who resided in the outer parishes. In 2013 thirty four percent (34%) of total births were of St. George's residents whilst in 2014 thirty eight percent (38%) of the births that occurred in St. George's were of mothers who resided in St. George's.

An examination of births by age of mother and order of births for both years shows that most of the births were to women in the 25 – 29 age groups, followed by the 20 – 24 and the 30 – 34 age - group. In 2013 thirty six percent (36%) were to mother's having their first born whilst in 2014 it was thirty eight percent (38%). Teenage births continue to remain under twenty percent (20%). In the past, teenage pregnancy has been of great concern and much attention has been directed to this problem. This has led to the implementation of programs with the aim of reducing teenage pregnancies. This goal has been met somewhat as evidenced by the percentage of births to teenage mothers and the actual number of births born to them. From the 1,838 births that occurred in 2013, one hundred and ninety six (198) were born to teenage mothers representing eleven percent (11%) of total births, whilst in 2014 there were one hundred and seventy three (173) births to teenage mothers representing less than ten percent (10%) of total births.

DEATHS

Mortality refers to the number of deaths in a population. In the year 2013 there were eight hundred and twenty two (822) recorded deaths whilst in 2014 there were nine hundred and fifty eight (958) recorded deaths representing an increase of sixteen point five percent (16.5%).

The Crude Death Rate which is defined as the number of deaths per 1,000 population in a given year is based on the number of deaths in that given year. The Crude Death Rate changed in the same direction as the total number of deaths for the period under review. In 2013 the crude death rate was 7.6 and increased in 2014 to 8.8.

A review of deaths by gender shows that male deaths continue to outnumber females' deaths. For both years male deaths were approximately fifty four percent (54%).

INFANT DEATHS

In the year 2013 there were thirty two (32) recorded infant deaths, whilst in 2014 there were thirty three (33). The infant mortality rate which shows the number of deaths to infants less than one year of age per 1,000 in a given year was 17.4 in 2013 and 18.9 in 2014.

The Neonatal rate was 8.2 in 2013 and 15.4 in 2014. The increase was due to the increase in the number of infants deaths under twenty eight days which was fifteen (15) in 2013 and twenty seven (27) in 2014. The Post Neo-Natal Rate for the same years was 9.2 and 3.4 respectively.

MARRAIGES

The number of marriage recorded increased from five hundred and sixty six (566) in 2013 to six hundred and eighteen (618). The months of August and December continues to be the most favorable months for marriages.

A review of marriages by the age of the bride and the groom shows that in the year 2013 most of the brides and grooms were of the age group 25-29. In the year 2014 most of the brides were from the age group 25 – 29 whilst the grooms were from the age-group 30-34.

The crude marriage rate which simply tells the number of marriages per 1,000 estimated mid-year populations in a given population was 5.2 for the years 2013 and 5.7 for the year 2014.

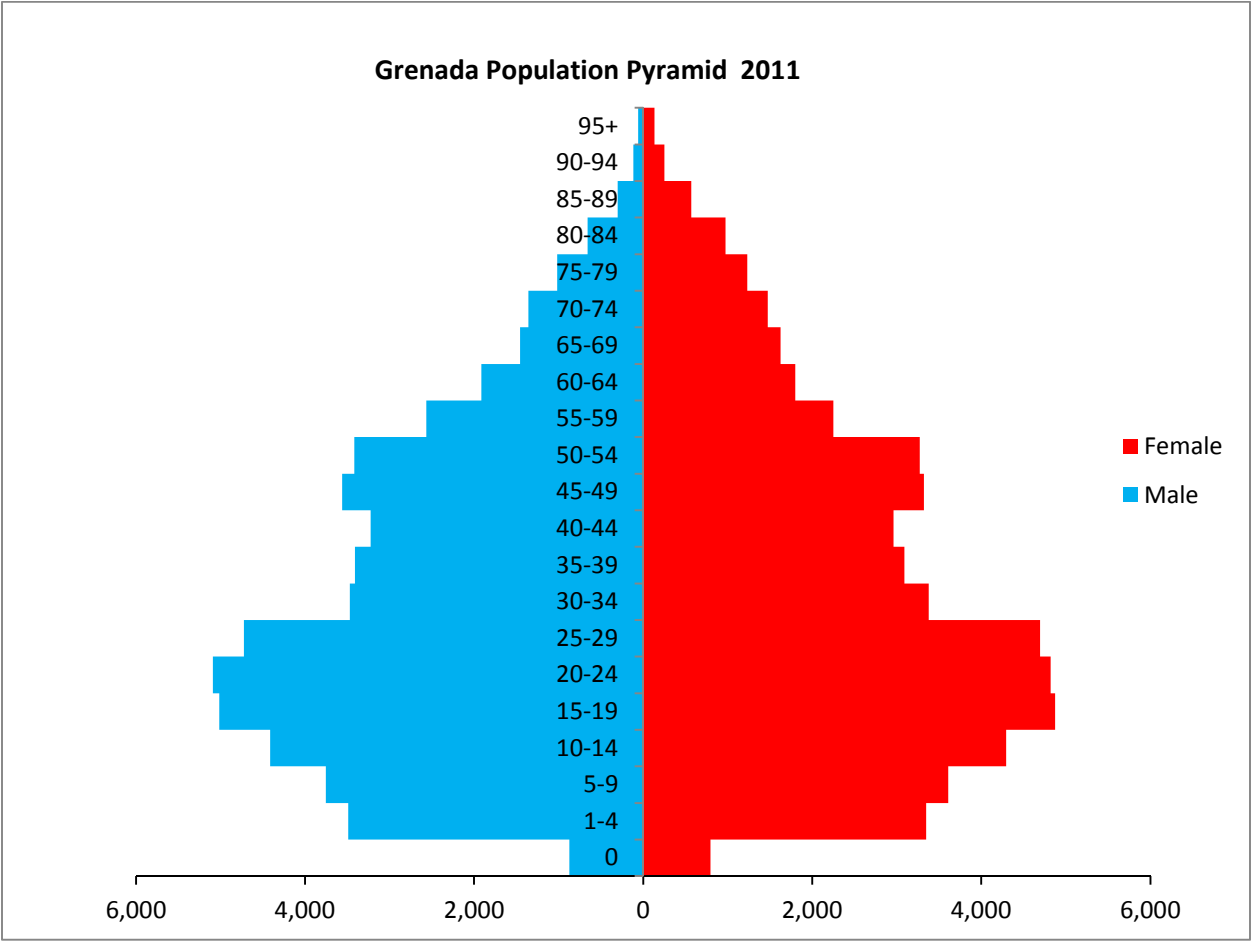

DIVORCES

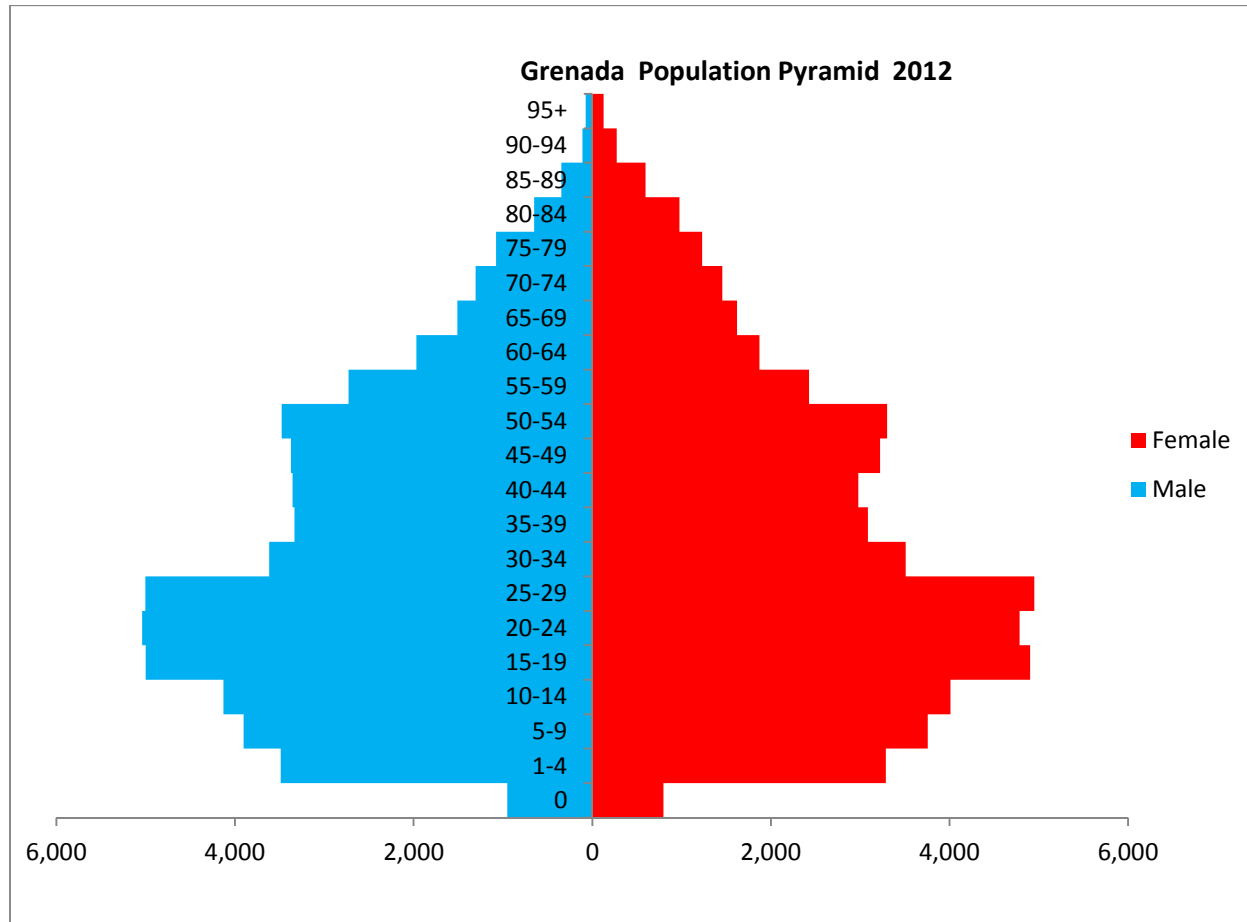

In 2013 there were one hundred and fifty eight (158) divorces recorded whilst for the year 2014 there were one hundred and nineteen.

A review of divorces by reason for divorce reveals that in 2013 most of the divorces were as a result of separation more than five years whilst in 2014 most of the divorces was as a result of broken marriage.
