FOREWORD

This report is published by the Central Statistical Office, Ministry of Finance and provides information on births, deaths, marriages and divorces. The responsibility for this publication rests with the Social and Demography section headed by Ms. Kenita Paul and its compilation was led by Ms. Cassandra Julien with the assistance of Mrs. Dalia Chitterman and Ms. Alice John.

The office trust that this publication will attract the interest of a wide cross-section of international, regional and local organizations, as well as demographers, planners, research workers and the general public also providing these interest groups a base series on vital statistics.

The office acknowledges the assistance and co-operation of the Registrar General's Department of the Ministry of Health in providing the administrative information used in the preparation of this publication.

In an effort to make this publication useful, revision in format and content will be constantly made and any suggestions for improvement as well as any notification of errors and omissions will be appreciated.

Halim Brizan (Mr.)
Director of Statistics
Central Statistical Office
Ministry of Finance

DEFINTIONS AND EXPLANATORY NOTES

AGE DEPENDENCY RATIO:

The ratio of persons in the “dependent” ages (under 15 and over 64 ages) to those in the “economically productive” ages (15-64 years) in a population.

$$\frac{\text{Population } < 15 + \text{Population } > 64 \times 100}{\text{Population } 15-64}$$

OLD AGE DEPENDENCY RATIO:

The ratio of persons aged 65 and over to those aged 15-64 years.

$$\frac{\text{Population } 65 \text{ and over} \times 100}{\text{Population } 15-64}$$

YOUTH DEPENDENCY RATIO:

The ratio of those aged under 15 to those 15 – 64 years.

$$\frac{\text{Population } < 15 \times 100}{\text{Population } 15-64}$$

SEX RATIO:

The ratio of males to females in a given population, usually expressed as the number of males for every 100 females.

$$\frac{\text{Number of males} \times 100}{\text{Number of females}}$$

FERTILITY

CRUDE BIRTH RATE:

The number of live births per 1,000 population in a given year.

$$\frac{\text{Number of live births in the year} \times 1000}{\text{Mid- year population}}$$

GENERAL FERTILITY RATE:

The number of live births per 1, 000 women aged 15-49 years in a given year. It is a refined measure than crude birth rate because it relates births precisely to women of childbearing age (i.e. women 15-49 years).

$$\frac{\text{Number of live births X 1000}}{\text{Number of women aged 15-49}}$$

GROSS REPRODUCTION RATE:

The average number of daughters that would be born to a woman (or group of women) during her lifetime if she passed through her childbearing years confirming to the age specific fertility rates of a given year.

$$\frac{\text{Number of female births X TFR}}{\text{Total births}}$$

AGE SPECIFIC FERILITY RATES:

The number of births for every 1,000 women in specific age groups. It is used for comparison over time or to see the differences in fertility behaviour at different ages.

$$\frac{\text{Number of births to women in specific age group X1000}}{\text{Number of women in specific age group}}$$

TOTAL FERTILITY RATE:

The average number of children that would be born alive to a woman (or group of women) during her lifetime if the present fertility rate continues unchanged.

The Total Fertility Rate is one of the most useful indicators of fertility because it gives as good an answer as possible to the question: How many children are women having today?

$$\frac{\sum \text{Age specific fertility rate X 5}}{1000}$$

MORTALITY**CRUDE DEATH RATE:**

The number of deaths per 1,000 population in a given year.

$$\frac{\text{Number of deaths in given year X 1000}}{\text{Mid- Year Population}}$$

NEONATAL MORTALITY RATE:

The number of deaths to infants under 28 days of age in given year per 1,000 live births in that year.

$$\frac{\text{Number of deaths to infants under 28 days X 1000}}{\text{Mid-year population}}$$

POST NEONATAL MORTALITY RATE:

The number of deaths to infants aged 28 days to 1 year per 1,000 live births in a given year.

$$\frac{\text{Number of deaths to infants 28 days - one-year X 1000}}{\text{Number of live births in year}}$$

INFANT MORTALITY RATE:

The number of deaths to infants under 1 year of age per 1,000 live births in a given year.

$$\frac{\text{Number of deaths to infants 0 to 1 year X 1000}}{\text{Number of live births in year}}$$

POPULATION CHANGE**RATE OF NATURAL INCREASE:**

The rate at which a population is increasing or decreasing in a given year due to a surplus or deficit of births over death expressed as a percentage of the base population.

$$\frac{\text{Birth in a given year - Deaths in the same year X 1000}}{\text{Mid - year population}}$$

CRUDE MARRIAGE RATE:

The number of marriages occurring among the population of a given geographical area during a given year, per 1,000 mid-year total population of the given geographical area during the same year.

$$\frac{\text{Number of marriages X 100}}{\text{Mid - year population}}$$

Source: Unless otherwise stated the table in this publication have been derived from data obtained from the Deputy Registrar General's Office, Ministry of Health.

ANALYSIS OF VITAL STATISTICS

The vital statistics report is a compilation of tables and charts of live births, deaths, marriages and divorces for the period 2015-2018.

LIVEBIRTHS

The period 2015 to 2018 has shown a decrease in the number of births however there was a slight increase from 2017 to 2018. The number of live births declined by 10.3% from one thousand six hundred and ninety-four (1,694) in 2015 to one thousand five hundred and twenty (1,520) in 2018. The year 2017 recorded the lowest total births for the period which was one thousand three hundred and ninety-eight (1398) births.

The decreasing number of live births unquestionably has affected all other fertility measures notably the crude birth rate and total fertility rate. The crude birth rate (CBR), defined as the number of live births per thousand population in a year, declined by 2 % from 2015 to 2018. The total fertility rate (TFR) defined by the number of children that would be born alive to a woman during childbearing years (i.e. 15-49) range between 1.5 and 2.0 during the period with an average of 1.8. This means on average women are having approximately two (2) children in their lifetime. A total fertility rate (TFR) of 2.1 children per woman is called the replacement- level fertility. Notwithstanding other factors such as immigration, migration and age structure, a TFR of less than 2.1 percent means that the population will eventually be decreasing. Hence, for the period 2015 to 2018 Grenada's fertility rate was below replacement level which is a condition for future population decline.

Further analysis of births shows that females of the age groups 20-24 and 25-29 usually have the highest number of births. Although births have been decreasing most women are still having children under the age of 30. Teenage births have been on a decline, there has been a reduction in teenage births over ten-year period from two hundred and twenty-nine (229) in 2009 to one hundred and thirty-seven (137) in 2018.

Teenage births percentages fluctuated between nine (9%) and ten (10%) percent of the total births for the period (2015-2018). The period under review showed a 3% decrease from the previous Vital Statistics publication of (2009-2012) where the percentage of teenage births were (13%) percent of total births.

DEATHS

There has been a steady increase in the number of deaths. At the start of the period (2015) there were a total of eight hundred and sixty-nine (869) deaths which further increased to a total of nine hundred and sixty-five (965) deaths in 2018.

Crude death rate (CDR), defined as the number of deaths per 1,000 population in a year, as expected given the increases in the total deaths, increased from 7.9% in 2015 to 8.6% in 2018. Male deaths on average accounted for approximately 55% of the total deaths.

INFANT DEATHS

Infant deaths fluctuated for the period (2015-2018). The highest number of infant deaths was 34 for the year 2017 whilst 2016 recorded the lowest with a total of 25. Generally male infant deaths are usually higher than female infant deaths however in 2016 the female infant deaths of fourteen (14) outnumbered the male infant deaths of eleven (11).

The Infant Mortality Rate (IMR) is computed as the number of deaths of infants 28 days to less than 1 year divided by the number of live births in the year. The IMR was at its highest in 2017, at a rate of 24% and at its lowest in 2018 with a rate of 15.8%. The post neonatal rate of 11.4% was significantly higher in 2017 in comparison to the other years of the period. This is as a result of that year (2017) having the lowest births and highest number of infant deaths.

MARRIAGES

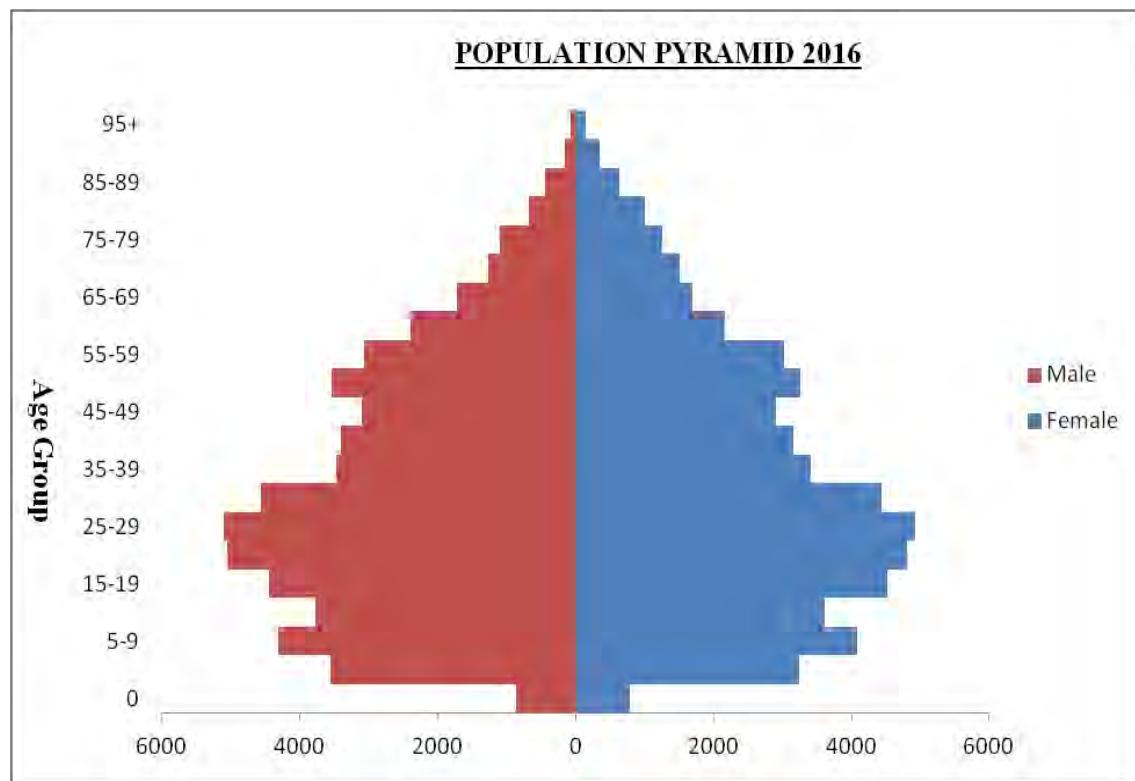

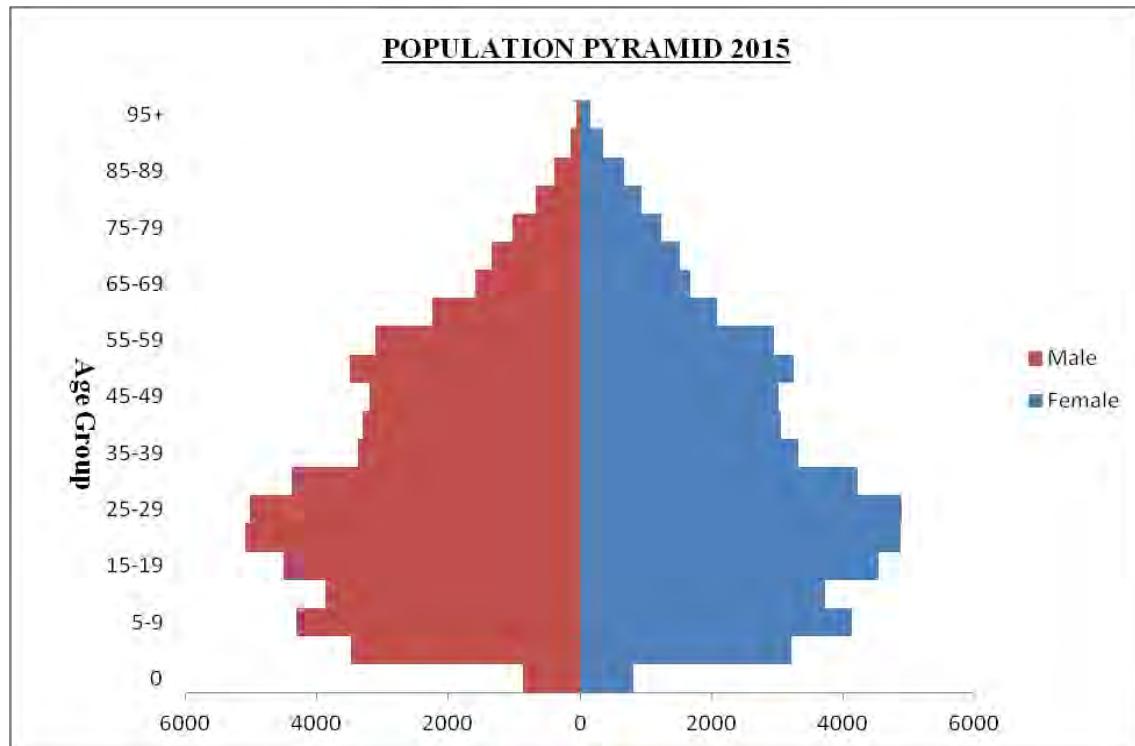

Overall, for the period marriages had little variations in its annual total. The lowest number of marriages were six hundred and nineteen (619) in 2018 whilst the highest number was six hundred and sixty-nine (669) in 2015. The highest percentage (%) of all brides were from the age group 25-29 which represented over 20% of the total brides.

The highest percentage (%) of all grooms were from the age group 30-34 which also represented over 20% of the total grooms. Overall, most marriages were between Bachelors and Spinsters averaging over 70% for the period.

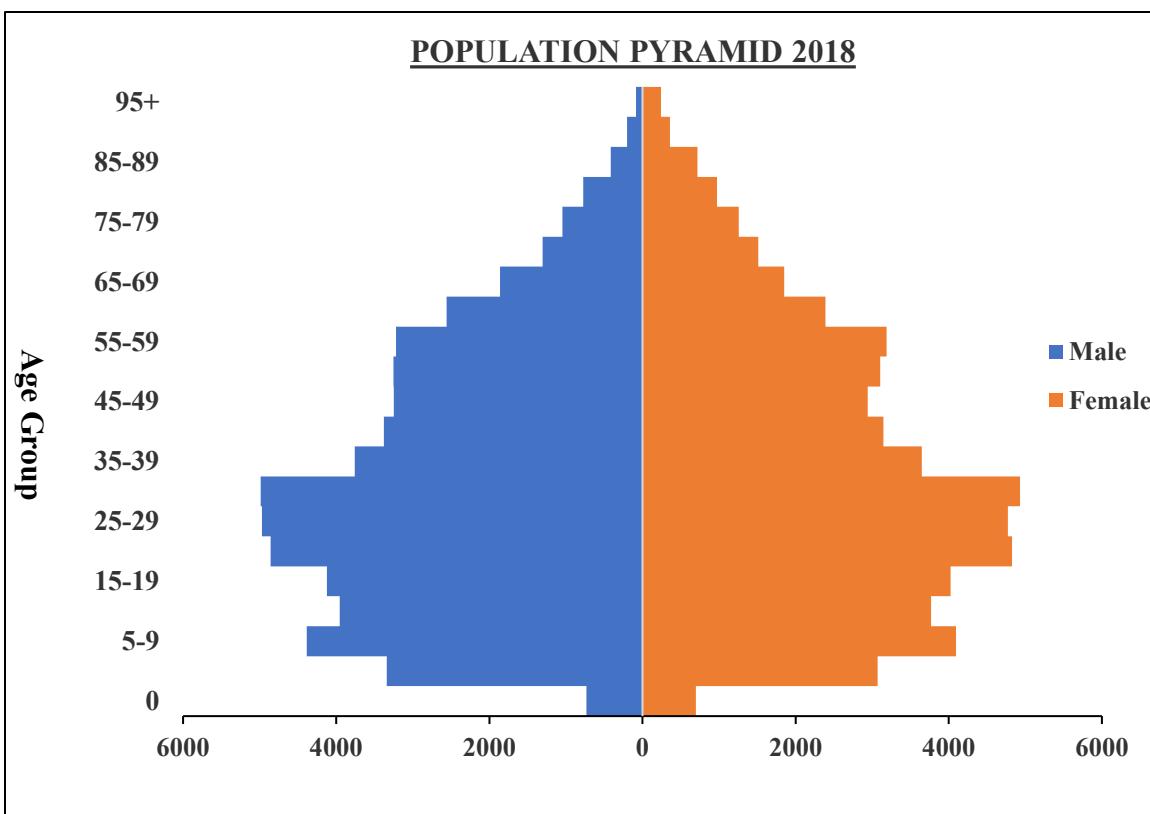

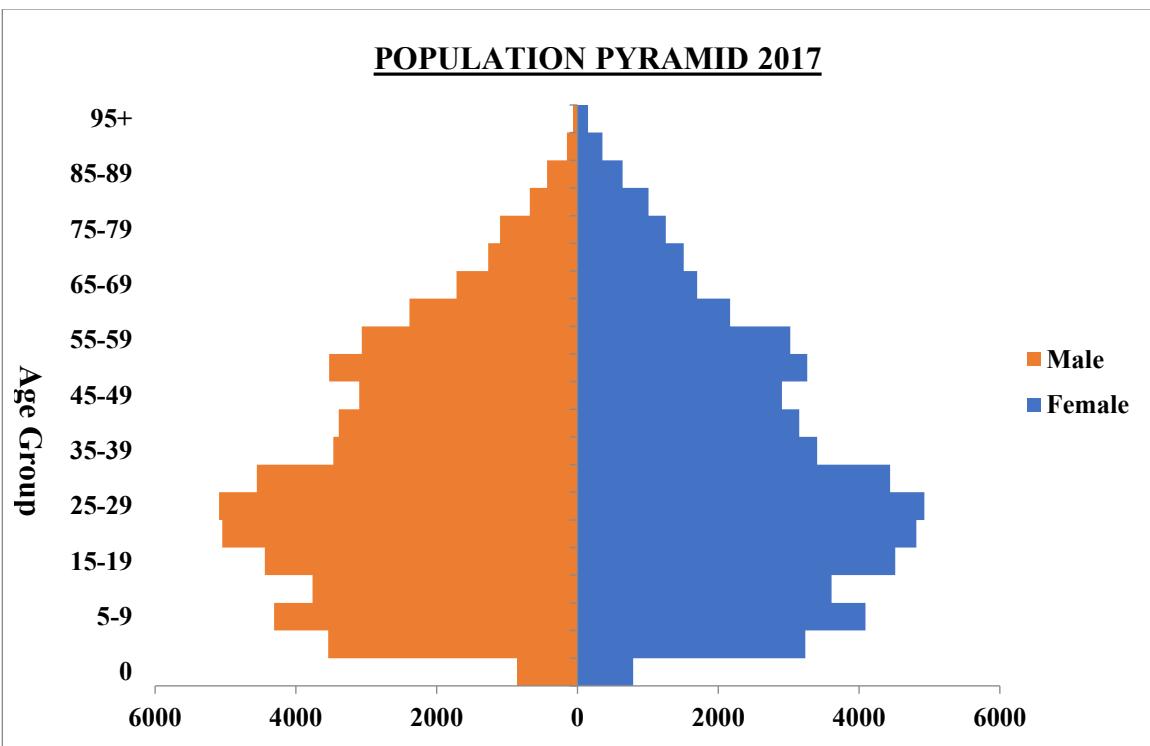

The months of December and August had the highest occurrence of marriages. The crude marriage rate computed as the number of marriages per 1,000 mid-year population was at its highest in 2015 with a rate of 6.1% and at its lowest in 2018 a rate of 5.5%.

DIVORCES

Throughout the last decade the number of divorces recorded did not have any significant decreases or increases. The lowest however for the period under review was in 2015 with a total of seventy- nine (79) divorces. However, 2018 recorded the highest total of one hundred and seventy-nine (179) divorces. This total is the highest also in the last decade although the difference in the increase is very small. The largest number of divorces are in the age groups 25-29 and 30-34 years. In the period under review 2015-2018 the highest number of divorces occurred within 5-9 years of marriage.
